ID ADE3
The invention comprises a conjugate that contains an N-terminal fragment of hepatocyte growth factor (HGF/SF) consisting of the hairpin domain and the four kringle regions of the alpha-chain and 1-3 polyethylene glycol (PEG) groups. The conjugate of the invention is useful for the preparation of a medicament for the treatment of cancer. The present amino acid sequence represents the human N-terminal four kringlecontaining fragment of hepatocyte growth factor (NK4).
                                                                                                                                                                        Conjugate comprises an N-terminal fragment of hepatocyte growth factor consisting of the hairpin domain and the four kringle regions of the alpha-chain and one to three polyethylene glycol groups, useful for treating cancer.
                                                                                                                                                                                                                                                    WPI; 2003-749561/71.

The invention is useful for producing a medicament for preventing or treating diseases caused by neovascularisation such as ovarian cancer, pancreatic cancer, stomach cancer, gallbladder cancer, renal cancer, prostatic cancer, breast cancer, esophageal cancer, hepatic cancer, oral canter, colon cancer, colorectal cancer, sarcoma, glioma and melanoma. The invention also useful in gene therapy. The present sequence is human NK4 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a transporter system for delivering concleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for drug testing). Other uses include to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from

                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                  cc delivering nucleic acid into a cell. The NTS contains but is not limited to 5 components; (a) the nucleic acid or a macromolecule to be delivered; (b) a moiety that recognizes and binds to a cell surface receptor or cc antigen or is capable of entering a cell through cytosis; (c) a nucleic cc acid or macromolecular molecule binding moiety; (d) a moiety that is cc capable of moving or initiating movement through a nuclear membrane; and/ cor (e) a lysis moiety that enables the transport of the entire complex cc from the cell surface directly into the cytoplasm of the cell. The NTS conditions of the cell as the nucleus cof specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create ctransgenic animals for assessing human disease, such as cancer, in an cc animal model. The NTS can be used in vitro with tissue culture cells. The Specific expression into specifically targeted tissue culture cells. The Cc specific expression into specifically targeted tissue culture cells. The Cc decradation

          acid. The nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, applipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of antigens.
                                                                                                                                               This invention describes a novel system (1) for delivering a nucleic acid to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic nuclear ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid delivery; nucleic acid transporter growth factor; clotting factor; apolipoprotein; tumor antigen; tumor suppressor; viral antigen;

The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells
                                                                                                                                                                                                                                                                                      Recombinant human hepatocyte growth factor

It has physiological activity, and using it enhanced growth of hepatocytes is possible. It is useful as a clinical diagnostic reagent, or a drug for treating hepatic disease. There are 4 kringle domains in the alpha-chain, similar to that of plasmin; the beta-chain has about 37 per cent homology with the beta-chain of plasmin having serine protease activity. Homology of the amino acid sequence of rat HGF and human HGF is 91.6 per cent in the alpha-chain and 88.9 per cent in the beta-chain. HGF has been found to be an agent for nephrocyte growth and is useful as a treatment for renal

Human modified (NP) HGF-A and -B fragments were prepared from human HGF cDNA. This was amplified by PCR to give a human NP-HGF DNA fragment that was transformed into E.coli. (see AAQ47833) for a related sequence

                                                                                                                                                                                                                                                                                                              The gene encodes an inhibitor of HGF, which has a molecular weight of ca. 76000 to 92000 as determined by SDS-PAGE. Human modified (NP) HGF-A and -B fragments were prepared from human HGF CDNA. This was amplified by PCR to give a human NP-HGF DNA fragment that was transformed into E.coli.

                                                          Sequence
                                                                                                  This sequence represents a single chain protein which selectively enhances the growth of vascular endothelial cells. This protein was produced by the human tumour cell line HUCCA-II or HUCCA-III. This protein enhances the formation of new blood vessels and may be used to enhance healing of wounds, burns injuries, decubitus or post-operative tissue damage. It may also be used as a drug for cardiac angiopathy. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                          Vascular endothelial cell growth factor protein - used for promoting angiogenesis in the treatment of cardiac angiopathy, wounds, burn injuries, postoperative tissue damage etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sudo

                                                                       sequence: Lys-Glu-Leu-Arg-
```

amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Ile-Glu-Gly-Arg-Thr, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by protease cleavage between residues 494-5, producing the alpha and beta chains. The novel sequence alters the protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. can be activated specifically at the site of injury in a blood vessel. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs. were generated by point mutations using the oligonucleotides AAT06762-5

(Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Lys-Gln-Gly-Arg-Thr, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by protease cleavage between residues 494-5, producing the alpha and beta chains. The novel sequence alters the protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs. were generated by point mutations using the oligonucleotides AAT06762-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure;

(Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Lys-Gln-Gly-Arg-Val, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by protease cleavage between residues 494-5, producing the alpha and beta chains. The novel sequence alters the protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs were generated by point mutations using the oligonucleotides AAR06762-5

                                                                                                                                                                                                The amino acid of the hepatocyte growth factor (HGF) generated to contain amino acid changes at residues 492-494. (Note - this sequence is not given in the specification but is based on the HGF sequence given in AAR20005). The generated mutant contains the sequence Lys-Gln-Gly-Arg-Ile, which replaces the wild type sequence Lys-Glu-Leu-Arg-Val. The HGF is translated as single chain protein which is activated to a two chain protein by protease cleavage between residues 494-5, producing the alpha and beta chains. The novel sequence alters the protease recognition site, putatively introducing a Factor Xa recognition site. The novel HGF deriv. (See AAR87522-5 for different HGF derivs.). The novel HGF derivs. were generated by point mutations using the oligonucleotides AAT06762-5
                                                                                                                                                                          Sequence 728
                                                                                                                                                                                                                                                                                                                                                                                                                Novel derivative of hepatocyte growth factor - comprises a mutation positions 492-494, for use in treating injured blood vessels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-MAY-1994;
